ALADIN audit, Phase 6: model E on the site, earlier models behind ALADIN BOT

Written 2026-11-10. Everything is on the `aladin-audit` branch. Nothing is on the live site until you write "approved phase 6".

What changed

Public site: one model

Every public page now shows only model E (momentum with a daily risk check).

Page	What a visitor sees now
Terminal, ALADIN tab	The market strip: NIFTY 500 against its 200-day average, the share invested, India VIX, breadth and 20 days of FII/DII flows. Alerts appear when there is something to report. A search for any stock. The ranked list shows, for each stock: its rank, its 6-month move, a state ("In the portfolio" or "No signal"), its group's record with 95% ranges, the expected lead after costs, and the size for your capital. Clicking a row gives 3 to 5 plain reasons. Below the list: a model-health panel with a calibration chart, and the paper account.
Terminal, Details panel	A short ALADIN block, e.g. "No signal · rank 35 of 500 · +64.5% in 6 months".
Home page	The ALADIN card shows E's rank and state.
Movers	The "quant" column shows E's block.
NEXUS	Does not show the Quant tab.

No price level to aim for is shown anywhere. Every percentage comes with its range. The words buy, sell, target, recommendation and guaranteed do not appear (the check passes).

Earlier models: still running, now private

As you asked, nothing was archived:

- **These all keep running and learning every night:** ALADIN 1, Outlook, ALADIN 2.0 (with its research pages), the old weekly signal, the movers model and the old paper bots.
- **What changed is only where their results are published.**

    - When the site is built, every file of theirs is encrypted with the ALADIN BOT access code.
    - The encryption is AES-256-GCM. The key is made from the code with PBKDF2-SHA256 at 600,000 rounds.
    - The readable copies are then deleted from the site.
    - For example, `aladin.json` now returns "not found" to the public.

- **When the bot is locked (every visitor):**

    - Their tabs and buttons are hidden.
    - None of their files is downloaded.
    - An old link such as `#v=lab` opens ALADIN BOT instead.

- **After you unlock ALADIN BOT with the same code:** an "Earlier ALADIN models" panel appears. It opens:

    - the old weekly signal and its paper bots
    - Tools (ALADIN 1)
    - Outlook
    - ALADIN 2.0's research pages

  "ALADIN probability" also comes back in Movers, as does an "Earlier models" block in the terminal's Details panel.

- **"Lock again" hides all of it** and makes this browser tab forget the code.

- **If the code is not set** in GitHub, the files are still removed, and the bot says they are not published. Nothing leaks.

Automation (no manual steps)

- The daily update runs `scripts/aladin_e.py` every evening, after the prices are saved.
- Both site builds (daily update and live prices) get the access code from the existing GitHub secret `ALADIN_BOT_CODE`. It is the same secret the bot already uses, and it is never printed or saved.

Problems found while checking, and fixed

1. **The old weekly signal stayed on "Loading…" after unlocking.**
    - Cause: two parts of the page each loaded their own copy of the unlock code.
    - Why: the site build stamps each script with a version, and the new unlock script was listed after a file that uses it, so the two got different addresses.

    - Effect: one copy was unlocked and the other was not.
    - Fix: the build order is corrected. The existing test `test_build_assets.py` now passes on the new build.
2. **Outlook said "not published yet" after unlocking.**
    - Cause: its data arrived, but the Outlook page was never redrawn.
    - Fix: it now redraws when the bot is unlocked and whenever the tab is opened.
3. **There was no way to lock again** when the bot's own console file can't be opened but the earlier models can. This happened in my local preview, which used a test code.
    - Fix: added a "Lock again" button to the earlier-models panel.

Tests

Suite	Result
Python (pytest), all tests	665 passed, 2 failed. Both also fail on the current main code without my changes (see below).
New: `tests/test_aladin_legacy.py`	3 passed: files are encrypted with no readable copy left; a wrong code can't open them; with no code the files are removed.
`tests/test_aladin_e.py`	12 passed
JavaScript (node --test), all tests	150 passed, 0 failed (6 new, for the ALADIN page and the lock)
Banned-word and disclaimer check	ok
New browser check: `tests/e2e/aladin_e_check.py`	19 of 19 passed
Updated browser checks (`predicted_check` , `nexus_check` , `aladin2_check` , `acceptance`)	These now unlock the bot with a test code before checking the earlier models. Every content check passes. The only failures are "0 console errors" lines, all caused by 404s for files this test copy lacks (`live.json` , `news.json` , `nse_live.json` , `t/quotes.json` , `t/fund.json`). Your main copy has those files. I will re-run these checks there before merging.

The two Python failures that were already there before:

- `test_fundamentals_fetch_stops_on_its_time_budget…` : it depends on how fast this computer writes files.
- `test_probabilities_exist_exactly_for_securities…` : three newly listed stocks (ARHAM, MONEYBOXX, GROWWSC250) don't match the saved data.

Neither touches model E or the lock. I am not sure the first one fails on GitHub's servers too.

Browser checks used a made-up test code only, never your real one.

Facts you should know

- **Model E as of the 9 Nov 2026 close:**
  - The NIFTY 500 is 3.5% above its 200-day average, so E is 70% invested.
  - Its portfolio is 25 stocks, with the next change in 63 sessions.
  - The paper account (₹1,00,000) places its first orders at the open after its first evening run on GitHub.
- **Size:** the encrypted files take about 32 MB on the site, against 20.5 MB readable, because encryption output is stored as text. That is well inside GitHub Pages' limit.
- **Survivorship bias:** the free data still only covers stocks listed today, so E's back-test is flattered (Phase 4). The 4-week forward test in Phase 7 is the honest check.

How to undo

Revert the Phase 6 commit on `aladin-audit`. If it has been merged, revert the merge commit on main. The earlier models were never changed or deleted, so they come back as they were.

Next

1. You write "approved phase 6".
2. I re-run the acceptance checks in the main copy and paste the results here.
3. If every check passes, I merge to main. Model E then goes live with the next daily update, and the earlier models move behind the bot.
4. Phase 7 then starts: 4 weeks of automatic daily paper trading, a plain-language report every Friday, and at the end a recommendation to Continue, Fix or Stop.
